SPIN WELD FITTINGS

Spin Weld Fittings are fittings that are attached by spinning them with a router until the friction fuses them to a tank or other plastic part.

Spin Weld Fittings generally take for form of threaded fittings and spin patches. The sizes are small, from 1/2” to 2”. Larger ones are available but we generally weld them since they are less reliable.

We install Spin Weld Fittings on Polyethylene tanks. These fittings are considered less secure than bulkheads or welded fittings but are quite acceptable for small tanks.

Spin Welds can be put in most tank locations except close to the edges. There has to be sufficient space for the friction bond to occur. Contact us to see how Spin Welds can help you.
