BRASS FDC ADAPTERS

Brass Fire Department Connection Adapters equip a water tank with the appropriate connection for a fire hose to be connected. That hose supplies a pumper truck with the water supply.

These swivel adapters are available in many sizes. The most common size has a 3" NPT thread on the end that connect with the tank and a 2-1/2" NH thread on the end the connects with the hose. NFPA 14 requires one 2-1/2" connection for each 250 gallons of required water flow.

A brass, NH threaded plug is included to keep the hose connector free of dirt and debris.

Brass construction makes for a rugged connector that give many years of maintenance free use.
