SIPHON TUBES

Siphon Tubes are tubes that are attached internally to a sidewall bulkhead or flange. The purpose of a siphon tube is to allow you to draw more liquid from a tank.

The larger the size of your sidewall fitting, the higher the centerline of the fitting needs to be installed. This leaves some amount of liquid in the tank that will not drain out.

A siphon tube extends from your fitting down toward the bottom of the tank. A siphon tube allows you to drain all but the lowest inch or two of the liquid in your tank.

We custom fit tanks with the fittings, options and accessories our customers need. Contact us to see how we can help you.
