WELDED PIPE SUPPORTS

Welded pipe braces are our normal way of attaching support for external and internal piping.

These supports are made of the same material as the tank and are attached by using thermoplastic welding. The supports differ by application, pipe size and the function they need to provide.

They are generally 4 to 5 inches wide and provide a 3 inch stand-off between the tank and pipe. Depending on the size of the tank, they may be made from 1/2" or 3/4" sheet material.

Pipe support material must match the material from which the tank is made in order to be welded. HDPE, Polypropylene and PVDF (Kynar) are available.

Pipe supports are also used inside our tanks to support suction pipes and other optional plumbing.

Supports are included in the price of options like top-fill lines, reverse float level indicators and other optional items. Pipe supports can be ordered and factory installed for piping that you will be installing on your tank.
